

What is Bcrypt?

Bcrypt is a lauded password-storing solution that uses complicated cryptographic algorithms, significantly reducing the chances of a hacker cracking your password.

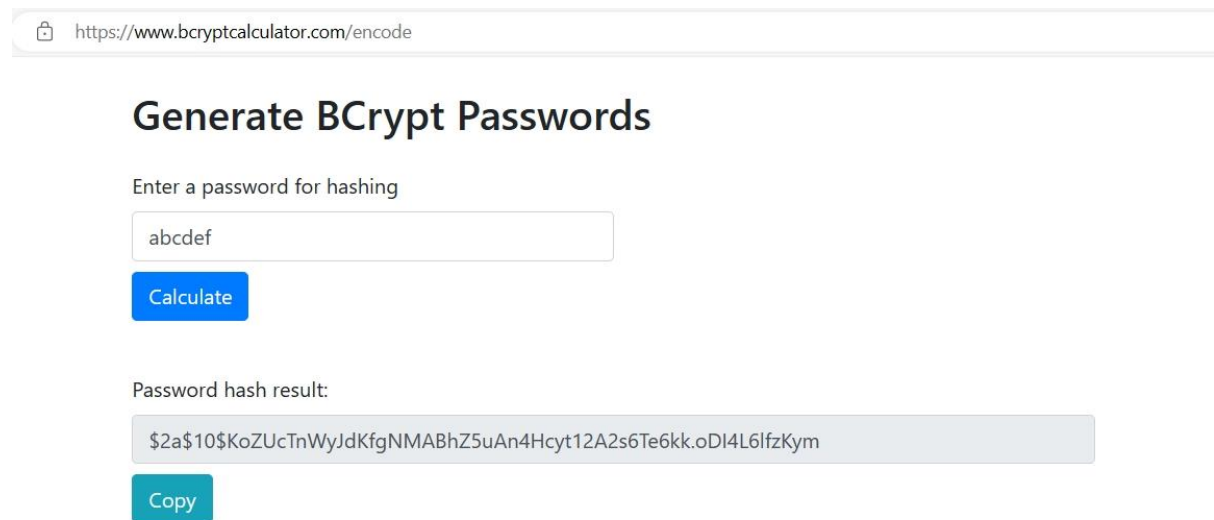

bcrypt is used to generate secure passwords from plain text using a hashing algorithm.

Website to generate bcrypt hash based on input text.

bcrypt is used with popular frameworks like spring boot, nodejs, Django.

Bcrypt Calculator

Screenshot

The screenshot shows a web browser window with the address bar displaying <https://www.bcryptcalculator.com/encode>. The main heading is "Generate BCrypt Passwords". Below this, there is a text input field labeled "Enter a password for hashing" containing the text "abcdef". A blue "Calculate" button is positioned below the input field. The output section, labeled "Password hash result:", shows a light blue box containing the hash "\$2a\$10\$KoZUCtnWyJdKfgNMABhZ5uAn4Hcyt12A2s6Te6kk.oDI4L6lfzKym". A teal "Copy" button is located below the hash box.
